The grfext package

Heiko Oberdiek*
<heiko.oberdiek at googlemail.com>

2016/05/16 v1.2

Abstract

This package provides macros for adding and reordering graphics extensions of package graphics.

1 Documentation

1.1 Introduction

If you are not familiar with LaTeX's graphics bundle, please read its documentation grffile [1]. The bundle contains two packages for graphics inclusion: graphics and graphicx. The first one is loaded by the second one that adds a key value interface.

Graphics files are included in both cases by macro \includegraphics. The file name extension can be omitted. Then the graphics package goes through a list of known extensions until it finds the graphics file. This extension list is set by \DeclareGraphicsExtensions. The previous contents of the list is overwritten.

1.2 User interface

This package grfext provides macros that adds entries to the list or remove them. The list may be empty or even undefined before. It is always defined afterwards, but can be empty (especially after removing entries).

\AppendGraphicsExtensions * {⟨*ext-list*⟩}
\PrependGraphicsExtensions * {⟨*ext-list*⟩}

The argument ⟨*ext-list*⟩ is a comma separated list whose entries are file name extensions including the dot. But first the entries are removed from graphics' extension list to avoid multiple occurences of the same extension.

Then macro \AppendGraphicsExtensions adds the entries after the end of graphics' list, whereas macro \PrependGraphicsExtensions puts them in front of the list. The order matters if a graphics file is available in different acceptable formats. Then the first extension wins.

The star version of these commands only adds an extensions, if a specific graphics rule exists for that extension.

\RemoveGraphicsExtensions {⟨*ext-list*⟩}

All occurences of file extensions in ⟨*ext-list*⟩ are removed from graphics' extension list.

1.3 Package loading

The package does not define any options. It is loaded as usual in LaTeX, e.g.:

```
\usepackage{grfext}
```

\PrintGraphicsExtensions

Macro \PrintGraphicsExtensions writes the current graphics extensions list in the .log file. The macros described before do this automatically after their operation.

1.4 Option support for package graphicx

Package graphicx uses the interface of package keyval in order to specify options for \includegraphics. The options can also be set using

\setkeys{Gin}{⟨*options*⟩}

The four user macros with the two star forms are available as options in family Gin as well:

AppendGraphicsExtensions={⟨*ext-list*⟩}
AppendGraphicsExtensions*={⟨*ext-list*⟩}
PrependGraphicsExtensions={⟨*ext-list*⟩}
PrependGraphicsExtensions*{⟨*ext-list*⟩}
RemoveGraphicsExtensions={⟨*ext-list*⟩}
PrintGraphicsExtensions

This makes it easier to locally change the extension list for an included graphics, e.g.:

\includegraphics[RemoveGraphicsExtensions={.pdf,PDF}]{image}

1.5 plain TEX

LATEX's graphics packages can also be used with plain TEX. The necessary basic LATEX macros are defined in miniltx.tex. This package grfext also relies on it. Example:

```
\input miniltx.tex\relax
\def\Gin@driver{pdftex.def}
\input graphicx.sty\relax
\input grfext.sty\relax
\resetatcatcode
```

2 Implementation

1 ⟨*package⟩

2.1 Reload check and identification

Reload check, especially if the package is not used with LATEX.

```

CTAN:macros/latex/contrib/oberdiek/grfext.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/grfext.pdf Documentation.

Bundle. All the packages of the bundle 'oberdiek' are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

CTAN:install/macros/latex/contrib/oberdiek.tds.zip

TDS refers to the standard "A Directory Structure for TEX Files" (CTAN:tds/tds.pdf). Directories with texmf in their name are usually organized this way.

4.2 Bundle installation

Unpacking. Unpack the oberdiek.tds.zip in the TDS tree (also known as texmf tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory TDS:scripts/oberdiek/ for scripts that need further installation steps. Package attachfile2 comes with the Perl script pdfatfi.pl that should be installed in such a way that it can be called as pdfatfi. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

[1] http://ctan.org/pkg/grfext

4.3 Package installation

Unpacking. The .dtx file is a self-extracting docstrip archive. The files are extracted by running the .dtx through plain TEX:

```
tex grfext.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as texmf tree):

```
grfext.sty             → tex/latex/oberdiek/grfext.sty
grfext.pdf             → doc/latex/oberdiek/grfext.pdf
test/grfext-test1.tex → doc/latex/oberdiek/test/grfext-test1.tex
test/grfext-test2.tex → doc/latex/oberdiek/test/grfext-test2.tex
grfext.dtx             → source/latex/oberdiek/grfext.dtx
```

If you have a docstrip.cfg that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

4.4 Refresh file name databases

If your TEX distribution (teTEX, mikTEX, ...) relies on file name databases, you must refresh these. For example, teTEX users run texhash or mktexlsr.

4.5 Some details for the interested

Unpacking with LATEX. The .dtx chooses its action depending on the format:

plain TEX: Run docstrip and extract the files.

LATEX: Generate the documentation.

If you insist on using LATEX for docstrip (really, docstrip does not need LATEX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{grfext.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfLATEX:

```
pdflatex grfext.dtx
makeindex -s gind.ist grfext.idx
pdflatex grfext.dtx
makeindex -s gind.ist grfext.idx
pdflatex grfext.dtx
```

5 Catalogue

The following XML file can be used as source for the TEX Catalogue. The elements caption and description are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is grfext.xml.

481 ⟨*catalogue⟩

482 <?xml version='1.0' encoding='us-ascii'?>

```
<!DOCTYPE entry SYSTEM 'catalogue.dtd'>

7 History

[2007/09/30 v1.0]

- First public version.

[2010/08/19 v1.1]

- User macros are also made available as keyval options for package graphicx.

[2016/05/16 v1.2]

- Documentation updates.
